

DATA AND COMPUTER COMMUNICATIONS

Lecture 4 Wide Area Networks - Asynchronous Transfer Mode

Mei Yang

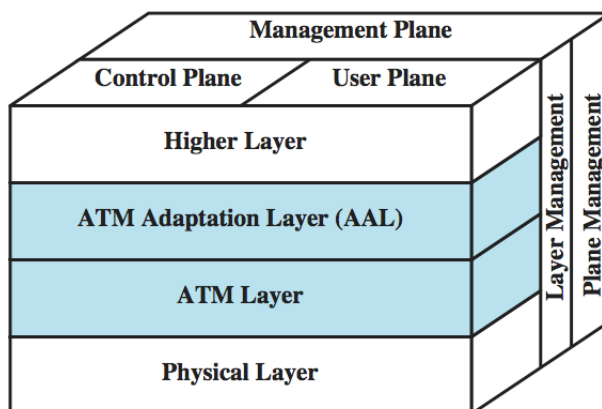

Based on Lecture slides by William Stallings

1

ATM

- a streamlined packet transfer interface
- similarities to packet switching
 - transfers data in discrete chunks
 - supports multiple logical connections over a single physical interface
- ATM uses fixed sized packets called cells
- with minimal error and flow control
- data rates of 25.6Mbps to 622.08Mbps

PROTOCOL ARCHITECTURE

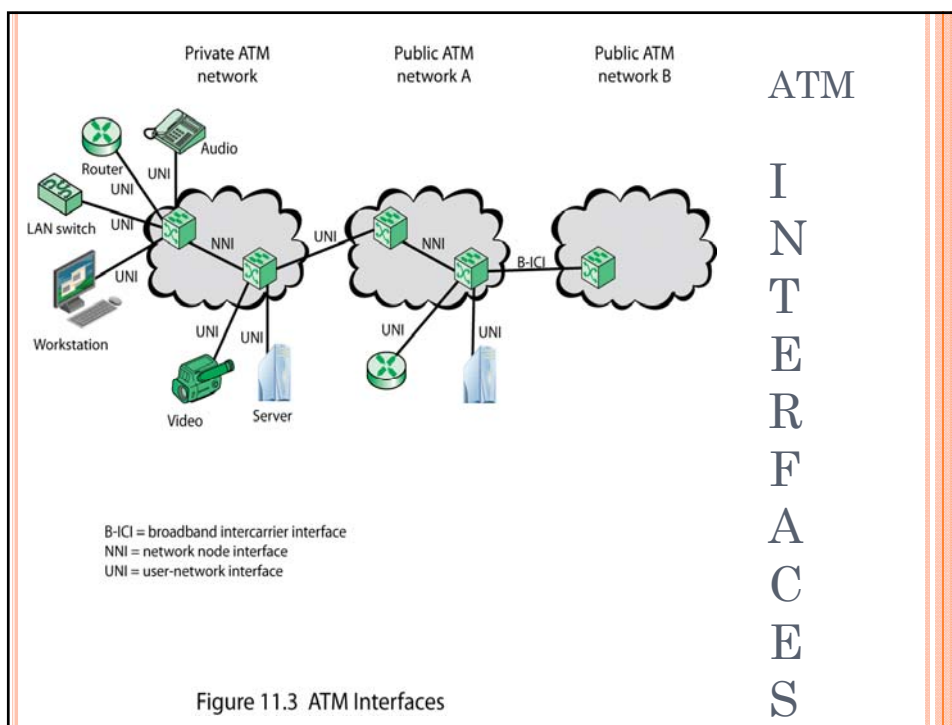

REFERENCE MODEL PLANES

- user plane
 - provides for user information transfer
- control plane
 - call and connection control
- management plane
 - plane management
 - whole system functions
 - layer management
 - Resources and parameters in protocol entities

ATM NETWORK INTERFACES

- switches are interconnected by point-to-point ATM links called **interfaces**
 - user-network interface (UNI)
 - network node interface (NNI)
 - interface specification includes:
 - definition of link types allowed
 - addressing formats
 - cell format
 - control signaling protocols

ATM LOGICAL CONNECTIONS

virtual channel connections (VCC)

- analogous to virtual circuit in X.25

basic unit of switching between two end users

- variable rate
- full duplex
- fixed size cells

VCCs also used for

- user-network exchange (control signaling)
- network-network exchange (network management and routing)

ATM LOGICAL CONNECTIONS

○ virtual channel connections (VCC)

- analogous to virtual circuit in X.25

○ basic unit of switching between two end users

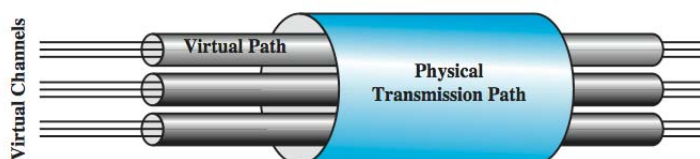

- full duplex
- fixed size cells

○ also for

- user-network exchange (control)
- network-network exchange (network mgmt & routing)

ATM VIRTUAL PATH CONNECTION

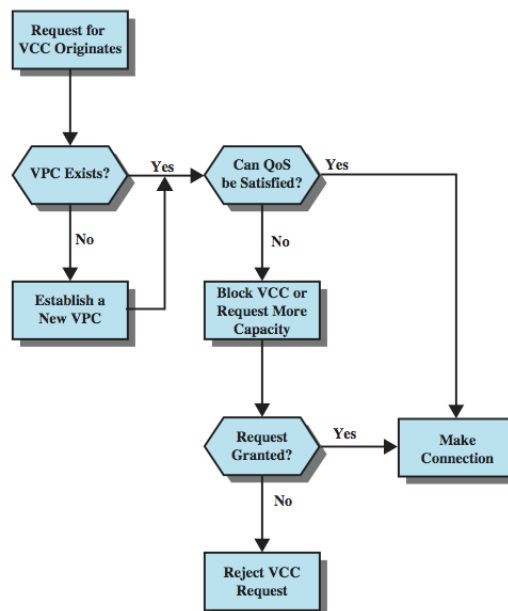

- virtual path connection (VPC)
 - bundle of VCC with same end points

ADVANTAGES OF VIRTUAL PATHS

- simplified network architecture
- increased network performance and reliability
- reduced processing
- short connection setup time
- enhanced network services

CALL ESTABLISHMENT USING VPS

VIRTUAL CHANNEL CONNECTION USES

- between end users
 - end to end user data
 - control signals
 - VPC provides overall capacity
 - VCC organization done by users
- between end user and network
 - control signaling
- between network entities
 - network traffic management
 - routing

VP/VC CHARACTERISTICS

- quality of service
- switched and semi-permanent channel connections
- call sequence integrity
- traffic parameter negotiation and usage monitoring

- VPC only
 - virtual channel identifier restriction within VPC

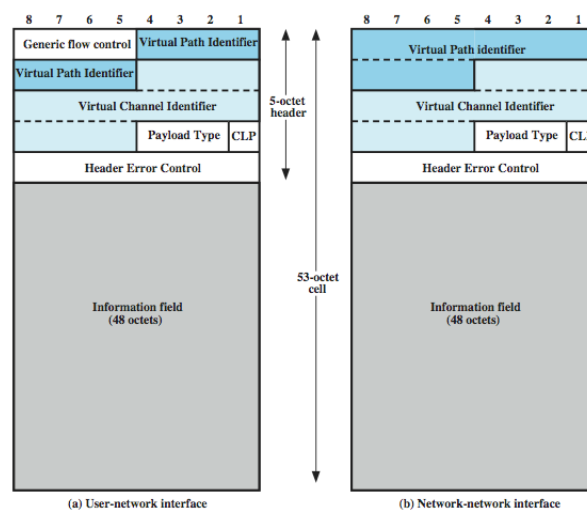

CONTROL SIGNALING - VCC

- to establish or release VCCs & VPCs
- uses a separate connection
- methods are:
 - semi-permanent VCC
 - meta-signaling channel
 - user to network signaling virtual channel
 - user to user signaling virtual channel

CONTROL SIGNALING - VPC

- methods for control signalling for VPCs:
 - Semi-permanent
 - Customer controlled
 - Network controlled

ATM CELLS

ATM HEADER FIELDS

- generic flow control
- Virtual path identifier
- Virtual channel identifier
- payload type
- cell loss priority
- header error control

GENERIC FLOW CONTROL (GFC)

- control traffic flow at user to network interface (UNI) to alleviate short term overload
- two sets of procedures
 - uncontrolled transmission
 - controlled transmission
- every connection subject to flow control or not
- if subject to flow control
 - may be one group (A) default
 - may be two groups (A and B)
- flow control is from subscriber to network

GFC - SINGLE GROUP OF CONNECTIONS

- If TRANSMIT=1 send uncontrolled cells any time. If TRANSMIT=0 no cells may be sent
- If HALT received, TRANSMIT=0 until NO_HALT
- If TRANSMIT=1 & no uncontrolled cell to send:
 - If GO_CNTR>0, TE may send controlled cell and decrement GO_CNTR
 - If GO_CNTR=0, TE may not send controlled cells
- TE sets GO_CNTR to GO_VALUE upon receiving SET signal

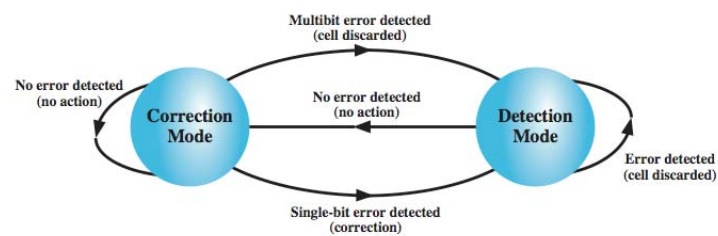

USE OF HALT

- to limit effective data rate on ATM
- should be cyclic
- to reduce data rate by half, HALT issued to be in effect 50% of time
- done on regular pattern over lifetime of connection

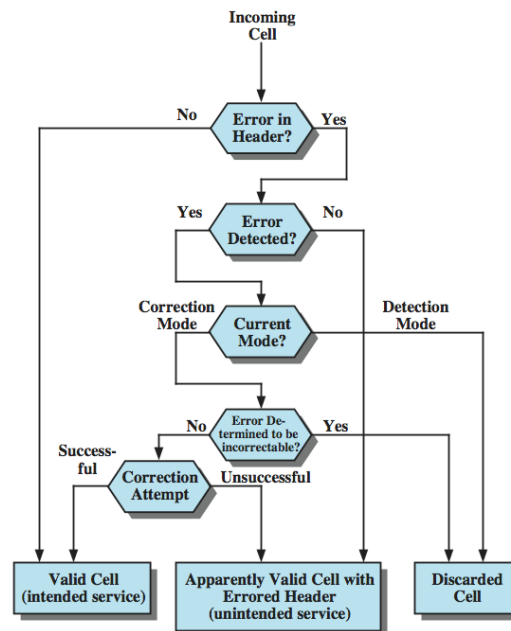

TWO QUEUE MODEL

- uses two counters each with current & initial values:
 - GO_CNTR_A
 - GO_VALUE_A
 - GO_CNTR_B
 - GO_VALUE_B

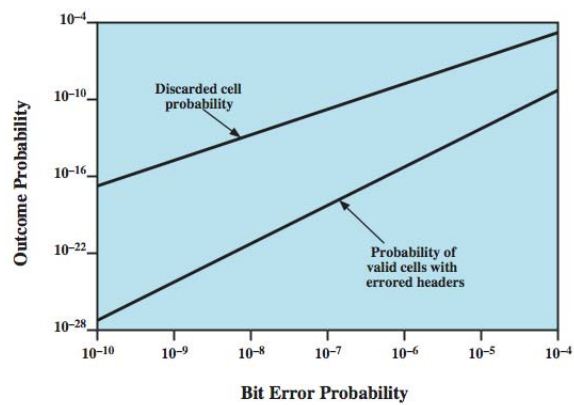

HEADER ERROR CONTROL

EFFECT OF ERROR IN CELL HEADER

IMPACT OF RANDOM BIT ERRORS ON HEC PERFORMANCE

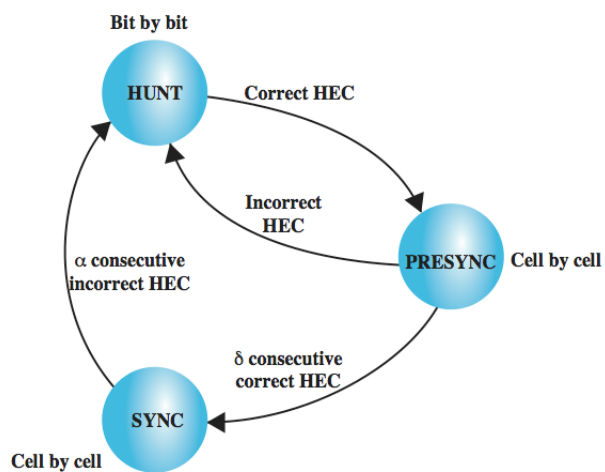

TRANSMISSION OF ATM CELLS

- I.432 specifies several data rates:
 - 622.08Mbps
 - 155.52Mbps
 - 51.84Mbps
 - 25.6Mbps
- two choices of transmission structure:
 - Cell based physical layer
 - SDH based physical layer

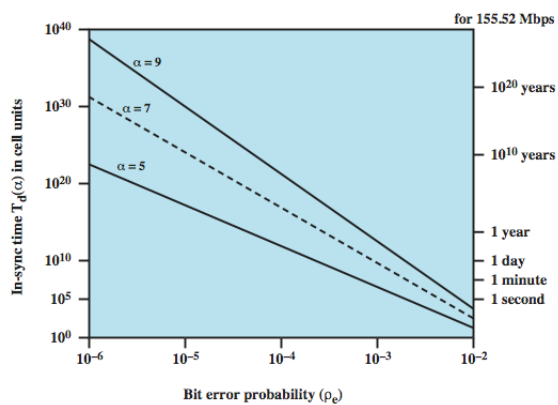

CELL BASED PHYSICAL LAYER

- no framing imposed
- continuous stream of 53 octet cells
- cell delineation based on header error control field

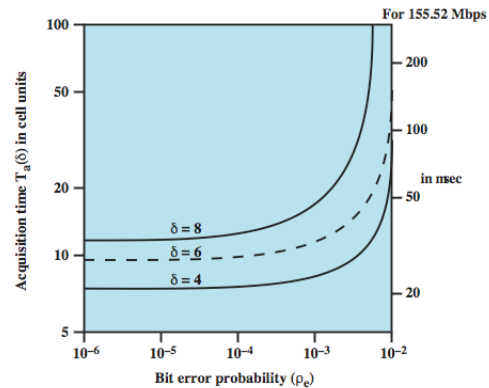

CELL DELINEATION STATE DIAGRAM

IMPACT OF RANDOM BIT ERRORS ON CELL DELINEATION PERFORMANCE

ACQUISITION TIME V BIT ERROR RATE

SDH BASED PHYSICAL LAYER

- imposes structure on ATM stream
 - eg. for 155.52Mbps
 - use STM-1 (STS-3) frame
- can carry ATM and STM payloads
- specific connections can be circuit switched using SDH channel
- SDH multiplexing techniques can combine several ATM streams

- 16

CONSTANT BIT RATE (CBR)

- fixed data rate continuously available
- tight upper bound on delay
- uncompressed audio and video
 - video conferencing
 - interactive audio
 - A/V distribution and retrieval

REAL-TIME VARIABLE BIT RATE (RT-VBR)

- for time sensitive applications
 - tightly constrained delay and delay variation
- rt-VBR applications transmit data at a rate that varies with time
 - eg. compressed video
 - produces varying sized image frames
 - original (uncompressed) frame rate constant
 - so compressed data rate varies
- hence can statistically multiplex connections

NON-REAL-TIME VARIABLE BIT RATE (NRT-VBR)

- it can characterize expected bursty traffic flow
 - eg. airline reservations, banking transactions
- ATM net allocates resources based on this
 - to meet critical response-time requirements
- giving improve QoS in loss and delay
- end system specifies:
 - peak cell rate
 - sustainable or average rate
 - measure of how bursty traffic is

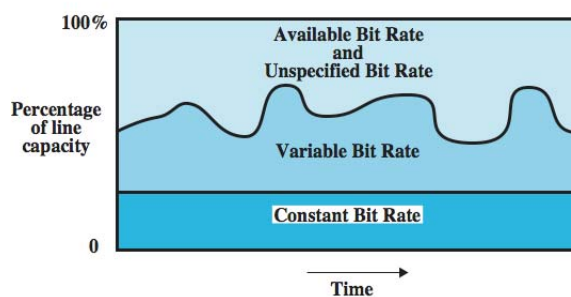

UNSPECIFIED BIT RATE (UBR)

- may be additional capacity over and above that used by CBR and VBR traffic
 - not all resources dedicated to CBR/VBR traffic
 - unused cells due to bursty nature of VBR
- for application that can tolerate some cell loss or variable delays
 - eg. TCP based traffic
- cells forwarded on FIFO basis
- best effort service

AVAILABLE BIT RATE (ABR)

- application specifies peak cell rate (PCR) and minimum cell rate (MCR)
- resources allocated to give at least MCR
- spare capacity shared among all ABR sources
 - eg. LAN interconnection

ATM BIT RATE SERVICES

SUMMARY

- Asynchronous Transfer Mode (ATM)
- architecture & logical connections
- ATM Cell format
- transmission of ATM cells
- ATM services
